STUDY DESCRIPTION

SADA STUDY NUMBER: 0010

TITLE: Study on Coronary Risk Factors Among Coloureds in the Cape Peninsula, 1982

PRINCIPAL INVESTIGATORS: Steyn, M; Steyn, K; and Langenhoven, M L.

ABSTRACT: This study was concerned with determining the communication media and the media preferences through which information in respect of preventing heart disease are obtained; attitudes towards healthy eating habits, stress control, physical exercise, combating smoking; knowledge regarding healthy eating habits; behaviour with regard to smoking, drinking, exercise, Type-A behaviour; and applying Rose's questionnaire to determine coronary pathology. It was an investigation of the Institute for Communication Research of the HSRC in co-operation with the National Institute for Nutritional Services of the Medical Research Council.

SAMPLING: Coloured men and women, 15 to 64 years old, in the Cape Peninsula: five age groups of about 100 men and women in each group. The sample was based on the enumerator sub-districts used by the Opinion Survey Centre. As a result of the quota principle in the stratified sampling there is a bias in respect of age in the investigation group. Each age group should therefore be treated separately when the data are processed. The return was 72% useable questionnaires. Before being finalised the questionnaires were tested in clinics on members of the same population from which the sample was drawn.

DATE OF RESEARCH: October 1982

EXTENT OF PROCESSING: rlay.sada

EXTENT OF COLLECTION: 1 data file in SPSS and machine-readable documentation and questionnaire.

Number of cases:	976	
Number of records:	904	
Number of records per case:		4
Logical record length:	80
